Dosage should be adjusted for depth of anesthesia, respiratory volume and rate. Dosage can be repeated in 15 to 20 minutes, if necessary.

DOSEAGE OF RESPIRAM™ (DOXAPRAM HYDROCHLORIDE, USP) FOR NEONATE USE

Neonate Canine
Doxapram may be administered either subcutaneously, sublingually (topically) or via the umbilical vein in doses of 1-5 drops (1-5 mg) depending on size of neonate and degree of respiratory crisis.

Technique for Umbilical Vein Administration:
When the neonate is presented through the incision of the uterus, placental membrane and fluid are removed from mouth and nose. A clamp is placed across the umbilical cord approximately 1-2 inches from abdomen of neonate. The umbilical vein is isolated and the selected dose of doxapram injected directly into the umbilical vein.

Neonate Feline
Doxapram may be administered either subcutaneously or sublingually (topically) in a dose of 1-2 drops (1-2 mg) depending on severity of respiratory crisis.

For further information including complete directions, precautions and warnings, please consult the product package insert.
